Tolerance Ring / Mounting Tools	18
Tolerance Ring R0810	18
Mounting tool R0536 for Ball Transfer Units R0535 and R0536	18

Product Overview

Ball Transfer Units make light work of shifting, rotating and directing unit loads. They have proven extremely valuable as integral parts of conveyor systems, feed devices, and machining and packaging equipment.

Applications

- General-purpose machines
- Feed tables for sheet-metal working machines
- Fixtures for press brakes
- Feed devices for machining centers
- Drilling machine tables and motor-driven supporting tables
- Assembly aids in the manufacture of large engines and motors

Conveyor Systems

- Ball transfer tables, turntables and switches for sorting and distribution systems
- Crossover sections of continuous conveyors
- Baggage sorting systems at airports
- Transport of steel tubes and pipes
- Lifting platforms

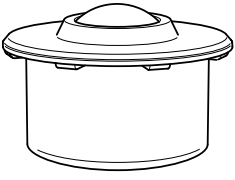

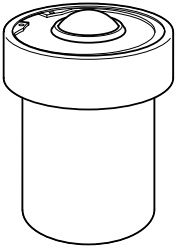

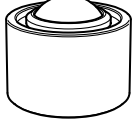

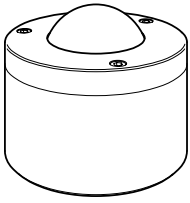

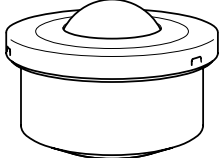

Other Fields

- Construction of special-purpose machines
- Aerospace industry
- Beverage and stone-processing industries

Further highlights

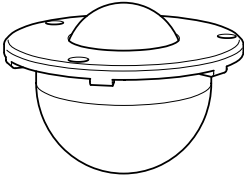

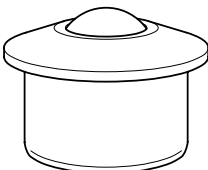

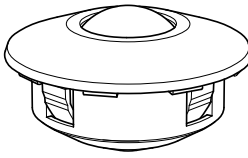

- Types for all standard applications and for many special solutions
- Easy mounting and extraction
- Conveying speed up to 2 m/sec in all types
- Consistently high quality
- High rationalization effect
- Smooth running
- Precise rolling and full load-bearing capability in any mounting orientation, even top-down

Technical Data

Structural design of the Ball Transfer Units

A hardened ball cup serves as a raceway for a multitude of small supporting balls. The supporting balls roll against the ball cup when the load ball turns. Rexroth Ball Transfer Units are designed so that precise rolling and full load-bearing capability are ensured in any mounting orientation.

Ball Transfer Units require little maintenance, and almost every type is protected against dirt by an oil-soaked felt seal.

Ball Transfer Units in corrosion-preventive design

Corrosion, caused by moisture or chemical attack, can lead to impaired functioning or even failure of the Ball Transfer Units. Coated (galvanized + chromated) surfaces similar to EN 12329 specifications and/or higher-grade materials offer enhanced anticorrosion protection.

Galvanized covers and housings

offer simple protection against corrosion. In this type, the supporting balls and load balls are made from standard antifriction bearing steel and are protected from corrosive attack by the lubricant.

Galvanized internals, corrosion-resistant steel balls

Consistent coating of all internals and the use of corrosion-resistant steels for the antifriction bearing elements, similar to ISO 683-17 specifications, ensures comprehensive corrosion protection such as specified in ASTM B117-03.

All parts made from rust and acid resistant steel

(Antifriction bearing steel to EN 10088)

This type is selected if the conveyed articles are abrasive and/or there is exposure to an aggressive environment, especially to chemicals.

Since all versions have been designed to meet the high standards of ISO 281, even this type is unsuitable for underwater use.

Mounting possibilities

Application example Ball Transfer Units used for assembling ball rail system runner blocks

Technical Data

Arrangement of the Ball Transfer Units

How the Ball Transfer Units should be arranged depends on the undersurface of the conveyed article. For articles with a uniform, smooth undersurface, such as boxes and cases, the distance between the Ball Transfer Units is calculated simply by dividing the smallest edge length by 2.5.

Example:
Undersurface of the conveyed article
= 500 x 1000 mm
Distance between Ball Transfer Units
 $a = \frac{500 \text{ mm}}{2.5} = 200 \text{ mm}$

Determining the load for Ball Transfer Units

To determine the load for a Ball Transfer Unit, the weight of the conveyed article is divided by 3. If the load ball height tolerances are well-correlated, it is possible, depending on the nature of the conveyed article, to also perform the calculation based on the number of load-bearing Ball Transfer Units.

Example:
Mass = 3000 N
Ball Transfer Unit load
 $F = \frac{3000 \text{ N}}{3} = 1000 \text{ N}$

Spring-loaded Ball Transfer Units

The figures in the column headed "Preload" are most important when choosing the size for these types. The weight of the conveyed article is divided in this case by the number of load-bearing Ball Transfer Units.

Conveying speed

$$V_{\max} = 2 \text{ m/s}$$

Load capacity

The stated load capacities apply to all mounting orientations and relate to 10^6 rotations of the load ball. In case of prolonged periods of use at speeds above 1 m/sec, an increase in temperature and reduced nominal life must be expected as a function of the load, especially for sizes 60 to 120.

Calculation of the nominal life

$$L = \left(\frac{C}{F}\right)^3 \cdot 10^6$$

L = nominal life (rotations)
 C = Load capacity (N)
 F = load (N)

Friction coefficients

The diagram shows the friction coefficients of Ball Transfer Units as a function of load and speed. These guideline values apply to any mounting orientation for rolling contact on a hardened steel plate.

Operating temperature

Ball Transfer Unit with steel load ball:

up to 100 °C.

At temperatures above 100 °C, only non-galvanized load balls without a felt seal should be used. Make allowance for reduction in load capacity. Use high-temperature lubricant! Follow the manufacturer's instructions! The existing lube oil may have to be washed out.

Ball Transfer Unit with plastic load ball:

up to 30 °C.

At temperatures above 30 °C, make allowance for reduction in load capacity.

Temperature factor

for steel load ball:

for plastic load ball:

Temperature (°C)	Temperature factor f_T	Temperature (°C)	Temperature factor f_T
125	0.9	40	0.9
150	0.8	50	0.8
175	0.7	60	0.7
200	0.5	80	0.5

The load capacity must be multiplied by the temperature factor.

Lubrication

The lubrication must be adapted to the conveyed articles and to the ambient conditions. The lubricant (oil) can be introduced via the load ball.

Cutout dimensions for Ball Transfer Units R0530, R0531 and R0535 (fixed seating)

Size	D	Dimensions of cutout D1 (mm) for	
		2 mm sheet steel 5 mm aluminum	16 mm wood
8	12.6 ±0,055	12.57 ^{+0,03}	12.50 ^{+0,05}
12	18.0 ±0,055	17.97 ^{+0,03}	17.90 ^{+0,05}
15	24.0 ±0,065	23.95 ^{+0,05}	23.90 ^{+0,05}
22	36.0 ±0,080	35.90 ^{+0,05}	35.85 ^{+0,07}
30	45.0 ±0,080	44.85 ^{+0,05}	44.80 ^{+0,10}
45	62.0 ±0,095	61.83 ^{+0,07}	61.80 ^{+0,10}

The cutout dimensions given are guide values for the installation of ball transfer units. The actual dimensions may vary according to the type and thickness of the material used as the mounting base and any constraints (vibrations, etc.). Users should therefore make trial cutouts to determine the correct dimensions.

Mounting Tool for Ball Transfer Units R0535 and R0536

for	Part number	Dimensions (mm)			α (°)
		D ₂	D ₃	t _{min}	
15	R0536 015 30	29	17	10	30
22	R0536 022 30	43	24	10	20
30	R0536 030 30	53	30	10	24
45	R0536 045 30	73	45	15	26
